Brain Machine Interfaces

We are investigating how the brain controls movements and how loss of limb function due to paralysis or amputation may affect the brain’s activity when thinking about movement.

This research could provide important information for developing better treatment options for limb function loss.

We are currently looking for people to participate in our research who have limb function loss due to:

Amputation, muscular degeneration or paralysis

Your brain activity will be measured using machines that record electrical and magnetic activity produced by your brain. The scanners are completely non-invasive and they are reliable and safe methods that has been used for many years.
